

Trippin (Travel App)

UX Draft for:

1. Home
2. Hamburger Menu

Menu: As you can see, we will have widgets and features that will require gesture so maybe we should just use this navbar item to slide in and out the hamburger menu to avoid conflicts (instead of the pan gesture)? Unless you think it won't be a problem. But of course you guys still have to approve this home viewcontroller before I can move forward.

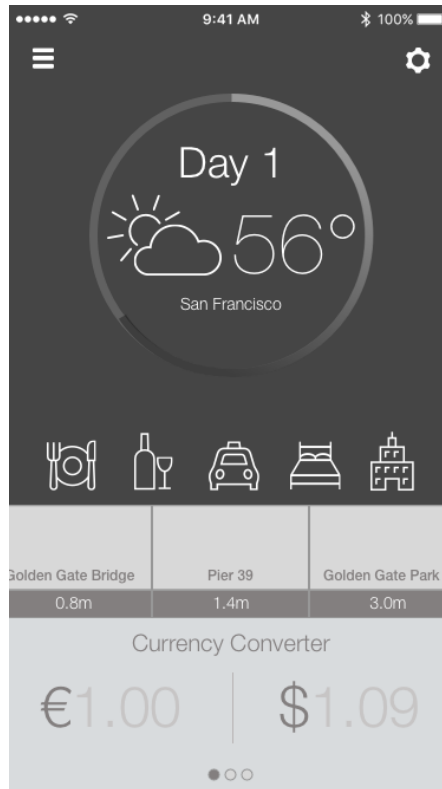

Quick Search nearby: Filtered results based on the tapped category: Dining, Night life, Transportation, Hotels, and Point of Interests. It will navigate to the Points of Interest View Controller with the results.

Bookmarked/Saved points of interest: (Horizontal scroll) Sorted by distance from current location. It will open a modal view with more details about the saved destination and then user can choose to start navigation.

Background: Blurred picture of the original location/city of the user. Or any image, it's blurred anyway.

I know that we talked about not adding additional features anymore but I think we missed out some important things. What happens next after the user's trip? There are photos, yes, but will the user just flush out all the bookmarks, finances tracking, etc. before using the app for another trip again? Or we could add a viewcontroller where the user can manage all the trips and then the finished trips will be saved in a form of a report (fake it till you make it??) This is why I asked about it on slack, the report is something we could do in the future. But it could be the thing that can make the app profitable. Imagine, we could track how users spend, their footsteps, decision making and all. Other features will be to invite/add another user as part of the trip and to create a track of all the places they've been during the trip. Please give your feedbacks on slack.

Thanks!

Background: Trip location landmark i.e. Golden Gate Bridge

Weather Widget: Circle slider that lets the user preview the weather for the whole 24hrs like the time travel feature of apple watch. (I already studied the implementation).

THREE WIDGETS: (paging view)

1. Currency Converter:

-Quick converter.
-If user taps on Currency Converter, it will navigate to the Finance View Controller

2. OCR Receipt | Bookings:

-Button to launch camera to take shots of the receipt or booking info.

3. To Do:

-Quick overview of the tasks.
-Shows max of 3 top priority tasks.

Background: Photos taken from the trip. It will open the Saved photos in location view controller.

Menu: Basic table view with icon.
